## Color combination for website templates

Paint samples color wheel fabric swatch paint color wheel fabric swatch you don't need to be an expert to match interior colours like a pro. Here are some steps to help you come up with color schemes that will give any room in your home a well thought-out look. Step 1 - MoodThe best place to start with interior design sets colors or what you see, but rather what you want to feel. If you want to express with your interior design think about the atmosphere or mood, it's easy to come up with the right color scheme. Is this room for comfort with comfortable furniture and soft lighting? Is it a modern kitchen with strong lines and sharp angles? Does the room mean having a blank canvas to display art or any other focal point? Thinking about the function and vibe of a room can lead you to choose logical groups of colors. If you want your room to have a classic, sleek look, you can never go wrong with black and white. If watching the sunset is your idea of heaven and you want your room to have the same glow, go for different shades of warm colors such as red, yellow and orange. Perhaps the beach is your favorite landscape- again make it with different shades of light brown, beige, white and blue. Step 2 - 60-30-10 RuleIf you want to be more scientific about how you match the inner color, use the 60-30-10 rule that tells you how much each color to use. Your main color should be used on 60 of the rooms, on the largest propagation such as walls. The second color in its color scheme should be used at 30 percent, like rugs, furniture and even ceilings on the next small parts of your interior design plan. The last 10 percent of your room is reserved for accents or supporting colors used on small soft furnishings. Chrome, copper or any other metal can have its 10 percent color, or you can use it on an accent wall. Use your color wheel to choose a family of colors and apply 60-30-10 rules to colors in that group. Step 3 - Following natural motivation sometimes, steps 1 and 2 is still not enough to help you choose a color scheme for your room. If you're still unsure about choosing colors, why not go for neutrals? Go out and take inspiration from the great outdoors. Take your main color from slate, brick or limestone or choose another color inspired by sand, earth or bark. Easy to match with those earth tones are color leaf green, sky blue or even the color of your favorite flower. Step 4 - Historical research looking into color schemes from other eras can give you some inspiration and silly-proof color combinations to follow. Modernist styles from Victorian to 60s were unique color combinations used for furniture, home design and fashion in every era. Look into some of these historical patterns and you might stumble upon the perfect color scheme for your room. Good typographic design is an important part of a successful website. self Using the outer style sheet and a style that is used in can change the font color on a website Paragraph tags. You can apply the same style property to change the font color to any tag that surrounds the text, including the &lt;body&gt; tag. Website font design is important. CSS gives you a lot of control over the presence of text on web pages you create for this example, you need to have an HTML document to see CSS changes and a separate CSS file associated with that document. We are going to look at the paragraph element, in particular, Ashley Nicole DeLeon/Lifewire To change the text color for every paragraph in your HTML file, go to the external style sheet and type P { }. Place the color property in style after the colon, such as P { COLOR: }. Then, add your color value after the property, finish it with semicolon: P { COLOR: BLACK; }. P { COLOR: BLACK;} Color values can be expressed as color keywords, RGB color numbers, or hexadecimal color numbers. In our example, para text is changed to color black. However, if you want to convert text color to green, blue, red, etc., you won't get the flexibility using the color keyword that you want to create different colors. That's where hexadecimal comes into play. P { COLOR: #000000; } This CSS style can be used to color your paragraphs in black because hex code translates into #000000 black. You can also use shorthand with that hex value and write it as #000 with the same result. P { COLOR: #25687; } As we mentioned above, hex values work well when you need a color that is not just black or white. The above CSS will set hex value paragraphs to blue, but unlike keyword blue, this hex code gives you the ability to set a very specific shade of blue, a mid-range, slate-like blue in this case. Hex works by installing one color RGB (red, green, blue) values separately with base-sixteen values. That's why they contain 0 digits through 9 plus letter one via F. Each color, red, green and blue, achieves its own double digit value. 00 the lowest value possible, while FF is the highest. Colors are listed in RGB order in a hex, so the first two digits represent the red value and so on. Finally, you can also use RGBA color values for font colors. RGCA is supported in all modern browsers, so you can use these values with the belief that it will work for most viewers, but you can also set an easy fallback.p { color: RGBA (47,86,135,1); } This RGBA value is similar to the slate blue previously specified. The first three values set red, green, and blue values and the final number is the alpha setting for transparency. Alpha setting means 100 percent to set to 1, so there is no transparency in this color. If you set that value to a decimal number, such as .85, it translates to 85 percent opacity and the color will be slightly transparent. { COLOR: #25687; Color: RGBA (47,86,135,1); } If you want to bulletproof your color values, the above CSS Copy. This syntax sets the hex code first and then overwrites that value. !t/body&gt;&lt;/body&gt; RGBA number. This means that any older browser that doesn't support RGBA will get the first value and ignore the second. It is important to note that the color property works on any HTML text element in CSS. For example, you can change all your link colors. A {color: #16c016;} The example above will make your link bright green. It works with too many elements at once. You can set every title level at once. h1, h2, h3, h4, h5, h6 { COLOR: #020833; } that will set all of your title elements to a midnight blue. It's not always easy to come up with hex or RGBA values for your colors. Most web designers will use their image editing program like Photoshop or GIMP to generate accurate code. You can also find convenient color picker tools online, like this from w3schools. Font colors can be replaced with an inline style within an outer style sheet, sheet of internal style, or HTML document. However, best practices dictate that you should use the external style sheet for your CSS styles. An internal style sheet, which are styles written directly in the head of your document, are generally only used for small, one-page websites. Inline styles should be avoided because they are similar to the old font tags we settled many years ago. Those inline styles make it very difficult to manage font styles because you have to change them on every instance of the inline style. Using website templates as a starting point for your site can be frowned upon by web designers and developers, but don't be disappointed if you need a website quickly and don't have the skills or time to craft your own HTML. There are a lot of decent templates out there, many of them are good-looking and highly functional. Here we've rounded up a few options that can open your eyes to the possibilities that website templates offer – at least when they're created by people who know what they're doing. Maple (WordPress) maple is easy to use and is fully responsive for six reasons you will love Maple, its developers say: its bold and unique design; The fact is that it is responsive and ready for the retina. The way it features light and dark styles; its paralex header background; its multi-sidebar support; And how super-easy it is to use. With 15 layout combinations as well as lots of features and widgets, at \$49 it gives you the price of your money. BeTheme (HTML5) they may not be all zingers, but you can't go wrong with BeTheme's selection yet (Image Credit: BeTheme) Why settle for a theme when you can be over 450? Described as the most complete, comprehensive and flexible HTML template for business or personal websites. Bethem has simply been crammed with stuff. Fully responsive and retina-ready, with all the parallax and smooth scrolling features, this is a complete monster and the biggest headache will be the reason you're trying to choose from a huge selection of pre-built sites. For \$17 you can't go wrong. Designed for NOHO (Muse) Creative. NOHO is perfect for departments (Image Credit: NOHO) designed with creative professionals in mind, NOHO being easy to edit in Adobe Idea designed, enabling you to acquire your agency site or portfolio and in record time. Its templates come in desktop, tablet and mobile flavours and many layouts and you will find ample features like image sliders, paralex scrolling and CSS rollover effects. The results are clean and eye-catching, and it's yours for just \$22.15. Jupiter (WordPress) confidently describes itself as the world's fastest and lightest WordPress theme, and its latest version has been fully reviewed and rewritten to deliver lightning-fast pages that won't beat your CPU or drain your battery. It uses GPU rendering to deliver smooth paralex scrolling, it features adaptive image resolution to ensure that images look great regardless of devices, and it comes with a huge amount of templates if you don't have time to create your pages with your drag and drop interface. It's not cheap at \$59, but the results are worth it. Es (WordPress) an image-centric website template (Image Credit: ES) A lot of modern themes focus on stark minimalism and type, but are far more interested in Rys imagery, whose goal is to get a photo blog or magazine faster and want to run. Priced at \$39, it's retina-ready and mobile-friendly, and feels like the high-end Photo Journal app in use. Bootstrap (HTML5) Bootstrap defaults look great in itself we know Bootstrap is actually a framework rather than a template. That's true, but as the example section displays, even bootstrap omissions look great if you have a design idea in mind that uses a lot more rich imagery and background. It's just a few variations from a pretty minimal composition – and it's even faster if you think of Bootwatch's free themes. Next: More top-class website templates templates
